| Week | Date | Topics | Reading | Assignment |
|------|----------------------|----------------------------------|------------------------|------------|
| 8 | Oct 27 | Midterm | All materials covered | |
| 9 | Nov 3 | | | |
| 10 | Nov 10 | | | |
| 11 | Nov 17 | Cloud secu | | |
| 12 | Nov 24 | AC/Authentication | | |
| 13 | Dec 1 | Economics | | |
| 14 | Dec 8 | Legal & ethical issues | | |
| 15 | Dec 10 (or later) | Final (closed “books”) | All materials covered* | |

Last week

- ◆ Ciphers in practice

- ◆ Revision

- ◆ the big picture, computational security, pseudo randomness, stream ciphers, PRGs

- ◆ Block ciphers, pseu

- ◆ Modes of operatio

- ◆ DES, AES

- ◆ Demo

- ◆ The Caesar and Vigenère ciphers and their cryptanalysis (Afternoon)

- ◆ Pseudo-randomness in practice (Evening)

Assignment Project Exam Help

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Recall: Integrity

Fundamental security property

- ◆ **an asset is modified only by authorized parties**

- ◆ “I” in the CIA triad

*“computer security
or **modification***

*viewing (confidentiality)
of access (availability)”*

<https://eduassistpro.github.io/>

Alteration

Add WeChat edu_assist_pro

- ◆ main threat against integrity of **in-transit** data
- ◆ e.g., MITM attack

Security problems studied by modern cryptography

- ◆ Classical cryptography: **message encryption**
 - ◆ early crypto schemes tried to provide **secrecy / confidentiality**
- ◆ Modern cryptography: **message authentication**
 - ◆ today we need to study **other security problems** beyond secrecy
- ◆ The sibling of message encryption: **message authentication**
 - ◆ another cornerstone of any secure system aiming to provide **authenticity & integrity**

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Message authentication: Motivation

Information has **value**, but only when it is **correct**

- ◆ random, incorrect, inaccurate or maliciously altered data is **useless** or **harmful**

- ◆ **message authentication** = message integrity + authenticity

- ◆ while in transit (**modified** by an outsider
- ◆ no outsider can **https://eduassistpro.github.io/** ender (or owner)

Add WeChat edu_assist_pro

- ◆ it is often necessary / worth to protect critical data
- ◆ **message encryption**
 - ◆ while in transit (or at rest), no message should be **leaked** to an outsider

Example 1

Secure electronic banking

- ◆ a bank receives an electronic request to transfer \$1,000 from Alice to Bob

Concerns

- ◆ who ordered the transaction?
- ◆ is the amount the intended one or was malicious while in transit?
- ◆ adversarial Vs. random message-transmission
 - ◆ standard error-correction is not sufficient to address this concern

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Example 2

Web browser cookies

- ◆ a user is performing an online purchase at Amazon
- ◆ a “cookie” contains session-related info, as client-server HTTP traffic is stateless
 - ◆ stored at the client
 - ◆ contains client-specific information
 - ◆ e.g., the user’s shopping cart along with a coupon

Concern

- ◆ was such state maliciously altered by the client (possibly harming the server)?

Integrity of communications / computations

Highly important

- ◆ any unprotected system cannot be assumed to be trustworthy w.r.t.
 - ◆ origin/source of information (due to impersonation attacks, phishing, etc.)
 - ◆ contents of information (due to impersonation attacks, email spam, etc.)
 - ◆ overall system functionality

Prevention Vs. detection

- ◆ unless system is “closed,” adversarial tampering with its integrity **cannot be avoided!**
- ◆ goal: identify system components that are not trustworthy
 - ◆ **detect tampering** or **prevent undetected tampering**
 - ◆ e.g., avoid “consuming” falsified information

Encryption does not imply authentication

A common misconception

“since ciphertext c hides message m , Mallory cannot meaningfully modify m via c ”

Why is this incorrect?

- ◆ all encryption schemes (one-time pad, i.e., masking via XOR)
- ◆ consider flipping a single bit to plaintext m ?
 - ◆ such property of one-time pad does not fit security definitions

Generally, secrecy and integrity are distinct properties

- ◆ encrypted traffic generally provides **no integrity** guarantees

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Problem setting: Reliable communication

Two parties wish to communicate over a channel

- ◆ Alice (sender/source) wants to send a message m to Bob (recipient/destination)

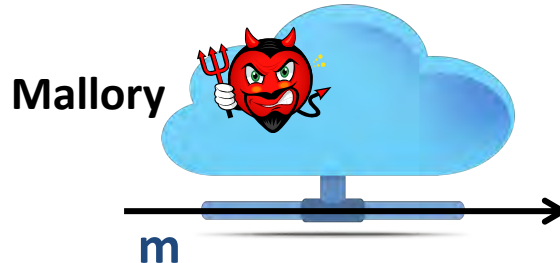

Underlying channel is unprotected

- ◆ Mallory (attacker/adversary)
- ◆ e.g., message transmission

Assignment Project Exam Help

<https://eduassistpro.github.io/>

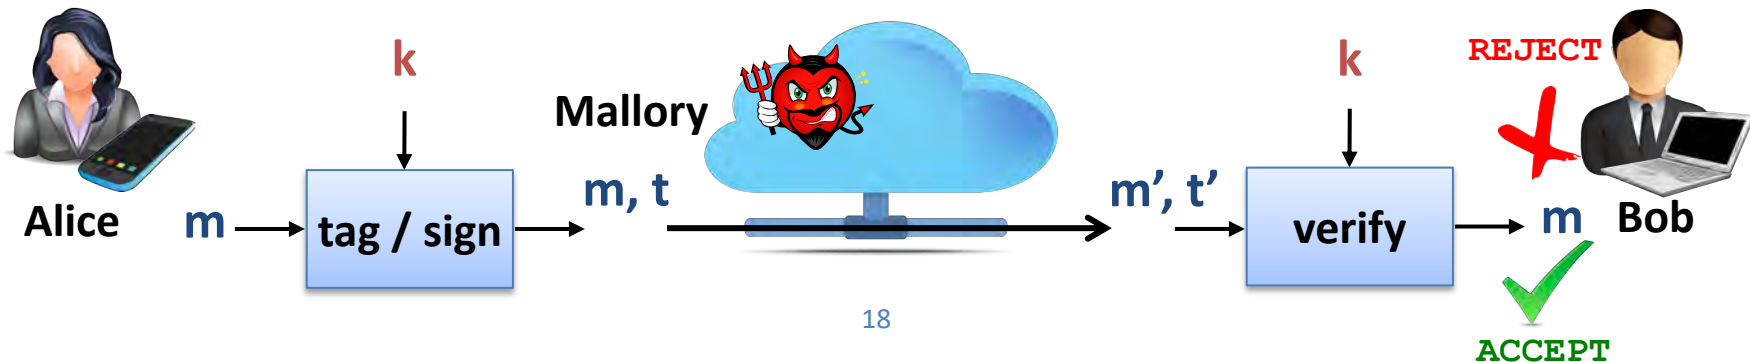

Add WeChat edu_assist_pro

Solution concept: Symmetric-key message authentication

Main idea

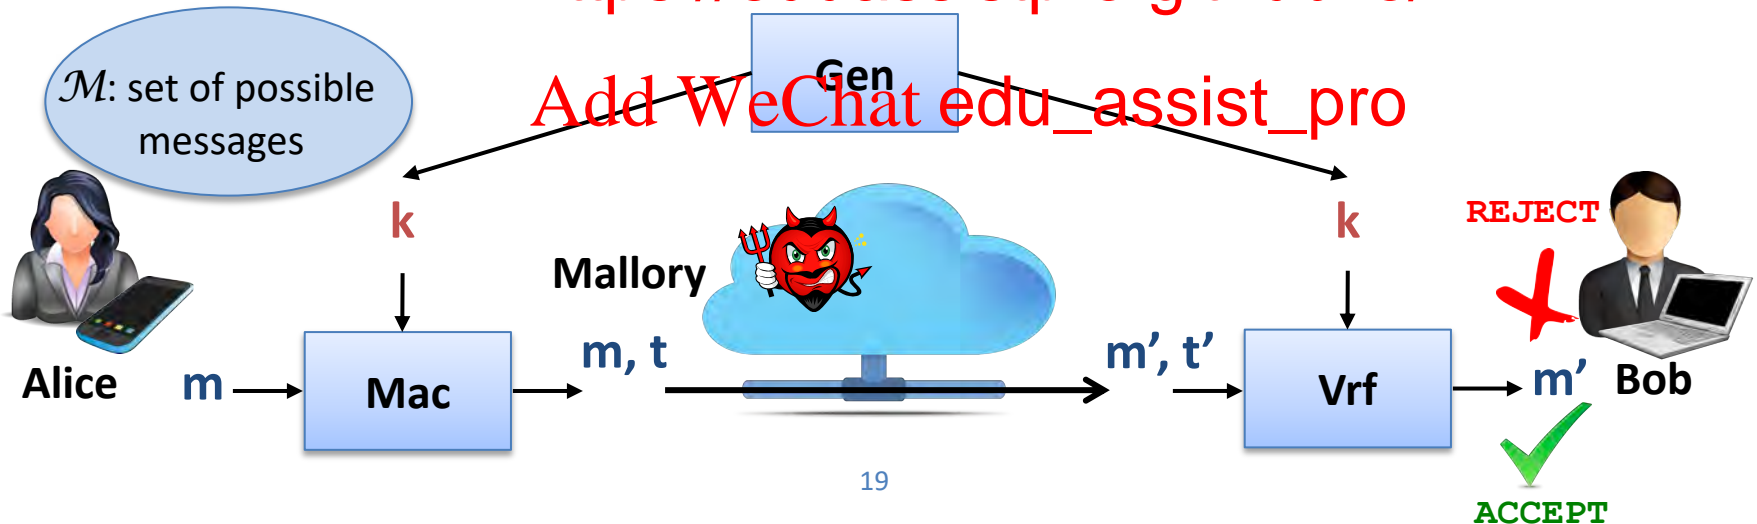

- ◆ secretly annotate or “sign” message so that it is **unforgeable** while in transit
- ◆ Alice **tags** her message m with **tag** t , which is sent along with **plaintext** m
- ◆ Bob **verifies** authentication
- ◆ Mallory can manipulate the verifiable pair m', t'
- ◆ Alice and Bob share a **secret key** k that is used in operations

Security tool: Symmetric Message Authentication Code

Abstract cryptographic primitive, a.k.a. **MAC**, defined by

- ◆ a **message space** \mathcal{M} ; and
- ◆ a triplet of algorithms $(\text{Gen}, \text{Mac}, \text{Vrf})$
 - ◆ Gen, Mac are probabilistic algorithms, whereas Vrf is deterministic
 - ◆ Gen outputs a uniform key space \mathcal{K}

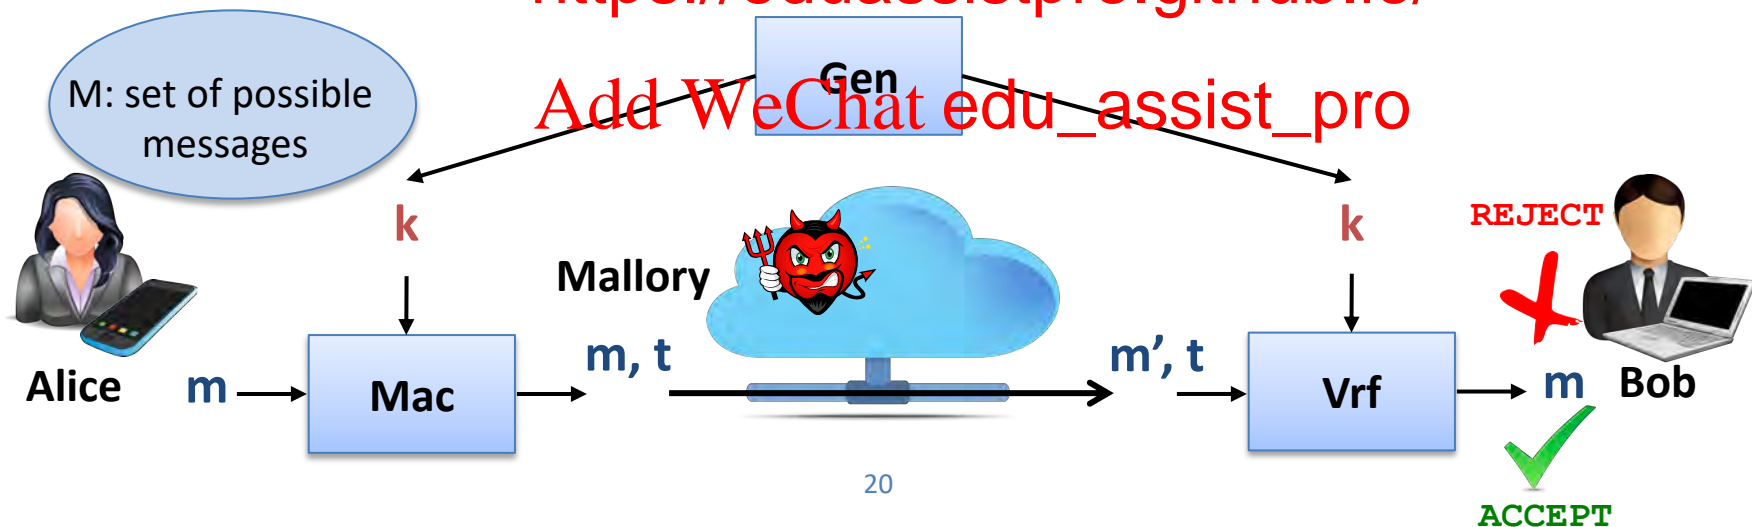

Desired properties for MACs

By design, any MAC should satisfy the following

- ◆ **efficiency:** key generation & message transformations “are fast”
- ◆ **correctness:** for all m and k , it holds that $\text{Vrf}(m, \text{Mac}_k(m)) = \text{ACCEPT}$
- ◆ **security:** one “

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Main application areas

Secure communication

- ◆ **verify authenticity of messages**

sent among parties

- ◆ **assumption**

- ◆ Alice and Bob **securely**
distribute and store s

- ◆ attacker does not learn key k

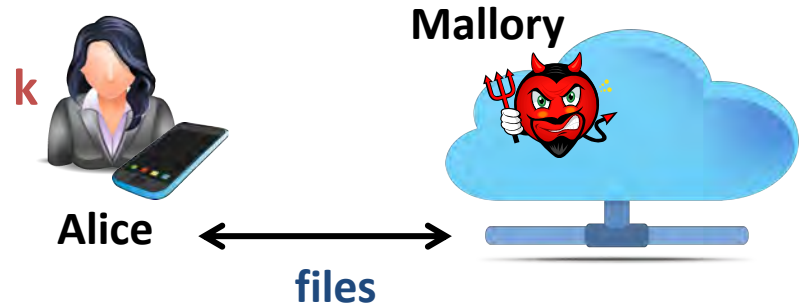

Secure storage

- ◆ **verify authenticity of files**

outsourced to the cloud

cloud generates and stores

not learn key k

Conventions

Random key selection

- ◆ typically, Gen selects key k **uniformly at random** from the key space \mathcal{K}

Canonical verification

- ◆ when Mac is deterministic, computing the tag t
 - ◆ $\text{Vrf}_k(m, t):$ 1. $t' := \text{Mac}_k(m)$ 2. if $t' = t$ then output ACCEPT else output REJECT
- ◆ but conceptually the following operations
 - ◆ authenticating m (i.e., running Mac) Vs. verifying authenticity of m (i.e., running Vrf)

MAC security

MAC scheme
(Gen, Mac, Vrf)

Attacker **wins** the game if

1. $\text{Vrf}_k(m^*, t^*) = \text{ACCEPT}$ &
2. m^* not in \mathcal{Q}

Gen \rightarrow k

Mac_k(m_i) \rightarrow t_i

\mathcal{T}

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

\mathcal{A} Mac(k,)

$\mathcal{Q} = m_1, m_2, \dots$

The MAC scheme is **secure** if any PPT \mathcal{A} wins the game only negligibly often.

Attacker **wins** the game if

1. $\text{Vrf}_k(m^*, t^*) = \text{ACCEPT}$ &
2. m^* not in \mathcal{Q}

Gen \rightarrow k

Mac_k(m_i) \rightarrow t_i

\mathcal{T}

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

\mathcal{A} Mac(k,)

$\mathcal{Q} = m_1, m_2, \dots$

The MAC scheme is **secure** if any PPT \mathcal{A} wins the game only negligibly often.

Real-life attacker

In practice, an attacker may

- ◆ observe a traffic of authenticated (and successfully verified) messages
- ◆ manipulate (or often also partially influences) traffic
 - ◆ aims at inserting an t^* into the traffic
 - ◆ interesting case: $t^* = t$ one
 - ◆ trivial case: forged message is a previous one, a.k.a. a **replay attack**
- ◆ launch a **brute-force attack** (given that $\text{Mac}_k(m) \rightarrow t$ is publicly known)
 - ◆ given any observed pair m, t , exhaustively search key space to find the used key k

Threat model

In the security game, Mallory is an adversary \mathcal{A} who is

- ◆ “active” (on the wire)
 - ◆ we allow \mathcal{A} to observe and intercept sent messages
- ◆ “well-informed”
 - ◆ we allow \mathcal{A} to request <https://eduassistpro.github.io/>
- ◆ “replay-attack safe”
 - ◆ we restrict \mathcal{A} to **forge only new** messages
- ◆ “PPT”
 - ◆ we restrict \mathcal{A} to be **computationally bounded**
 - ◆ new messages may be forged undetectably only negligibly often

Notes on security definition

Is it a rather strong security definition?

- ◆ we allow \mathcal{A} to **query MAC tags for any message**
 - ◆ but real-world senders will authenticate only “meaningful” messages
- ◆ we allow \mathcal{A} to break t **sage**
 - ◆ but real-world attac **messages**

Yes, it is the right approach...

- ◆ message “meaningfulness” depends on hig ation
 - ◆ text messaging apps require authentication of English-text messages
 - ◆ other apps may require authentication of binary files
 - ◆ security definition should better be **agnostic** of the specific higher application

Notes on security definition (II)

Are replay attacks important in practice?

- ◆ absolutely yes: a **very realistic & serious threat!**

- ◆ e.g., what if a money transfer order is “replayed”?

Yet, a “replay-attack sa

- ◆ again, whether replay

- ◆ better to delegate to this app the specific

- ◆ e.g., semantics on traffic or validity chec

able

<https://eduassistpro.github.io/>

higher-lever app

Add WeChat edu_assist_pro

ails

before they’re “consumed”

Eliminating replay attacks

- ◆ use of counters (i.e., common shared state) between sender & receiver
- ◆ use of timestamps along with a (relaxed) authentication window for validation

C con

Add WeChat edu_assist_pro

Three generic MAC constructions

- ◆ fixed-length MAC

- ◆ direct application of a PRF for tagging
- ◆ limited applicability

- ◆ domain extension fo

- ◆ straightforward secu
- ◆ inefficient

- ◆ CBC-MAC

- ◆ resembles CBC-mode encryption
- ◆ efficient

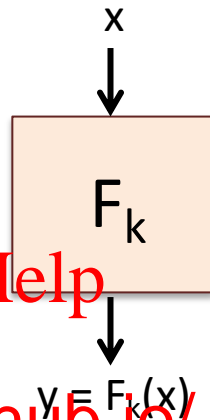

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

1. Fixed-length MAC

- ◆ based on use of a PRF
 - ◆ employ a PRF F_k in the obvious way to compute and canonically verify tags
 - ◆ set tag t to be the p derived by evaluating
- ◆ secure, provided that F_k is a secure PRF

AC scheme Π

$(1^n): \{0,1\}^n \rightarrow k$

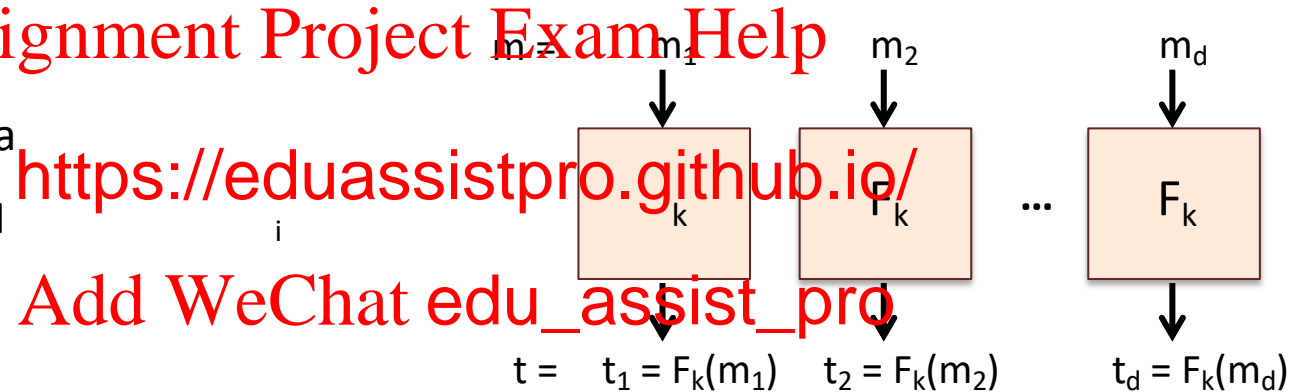

$\text{Mac}_k(m)$: set $t = F_k(m)$

$\text{Vrfy}_k(m,t)$: return 1 iff $t = F_k(m)$

2. Domain extension for MACs (I)

- ◆ suppose we have the previous fix-length MAC scheme
- ◆ how can we authenticate a message m of arbitrary length?
- ◆ naïve approach

- ◆ pad m and view it as a sequence of blocks m_1, m_2, \dots, m_d
- ◆ separately apply MAC function F_k to each block

- ◆ security issues
 - ◆ reordering attack; verify block index, $t = F_k(m_i || i)$
 - ◆ truncation attack; verify message length $\delta = |m|$, $t = F_k(m_i || i || \delta)$
 - ◆ mix-and-match attack; randomize tags (using message-specific fresh nonce)

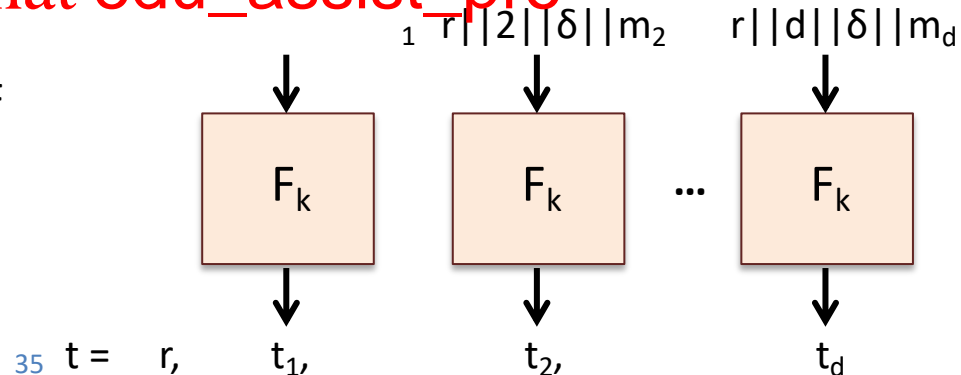

2. Domain extension for MACs (II)

Final scheme

- ◆ assumes a secure MAC scheme for messages of size n
 - ◆ set tag of message m of size δ at most $2^{n/4}$ as follows
 - ◆ choose fresh random r
 - ◆ separately apply M
- blocks of size $n/4$ each
iso its index, δ and nonce r

Security

- ◆ extension is secure, if F_k is a secure PRF

3. CBC-MAC

Idea

- ◆ employ a PRF in a manner similar to CBC-mode encryption

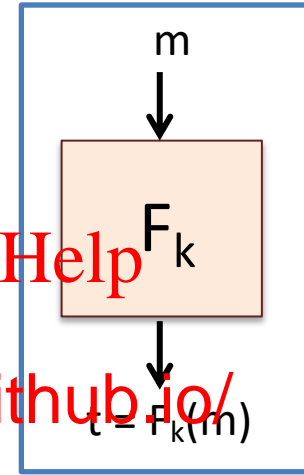

Security

- ◆ extension is secure, if
 - ◆ F_k is a secure PRF; and
 - ◆ only **fixed-length** messages are authentic
- ◆ messages of length equal to any multiple of n can be authenticated
 - ◆ but this length need be fixed in advance
 - ◆ insecure, otherwise

3. CBC-MAC Vs. previous schemes

- ◆ can authenticate longer messages than basic PRF-based scheme (1)

Scheme (1)

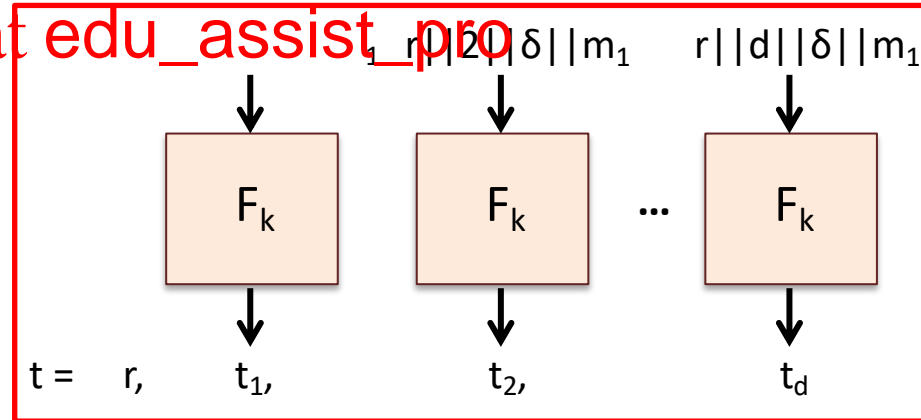

Assignment Project Exam Help

<https://eduassistpro.github.io/>

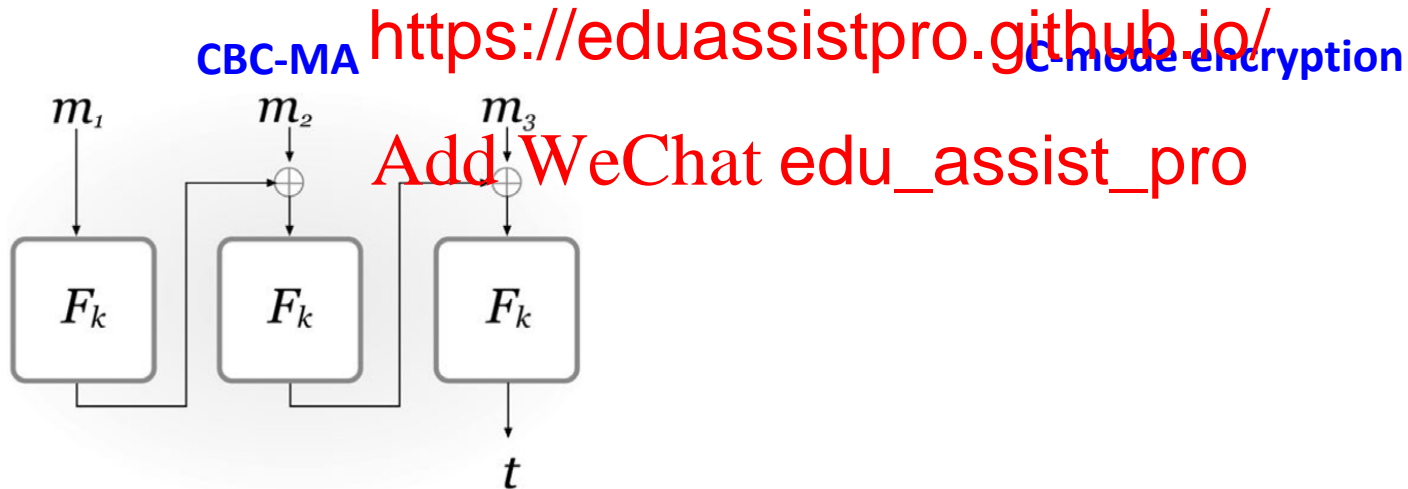

Add WeChat edu_assist_pro

- ◆ more efficient than domain-extension MAC scheme (2)

3. CBC-MAC Vs. CBC-mode encryption

- ◆ crucially for their security
 - ◆ CBC-MAC uses **no IV** (or uses an IV set to 0) and only the **last PRF output**
 - ◆ CBC-mode encryption uses a **random IV** and **all PRF outputs**
 - ◆ “simple”, innocent

Assignment Project Exam Help

<https://eduassistpro.github.io/>
h func

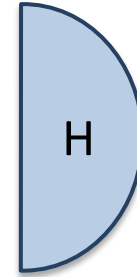

Add WeChat edu_assist_pro

Cryptographic hash functions

Basic cryptographic primitive

- ◆ maps “**objects**” to a **fixed-length** binary strings
- ◆ core security property: mapping **avoids collisions**
- ◆ **collision**: distinct ob
- ◆ although collisions _____

input
arbitrarily
long string

output
short digest,
fingerprint,
“secure”
description

hash value ($H(x) = H(y)$)

to find

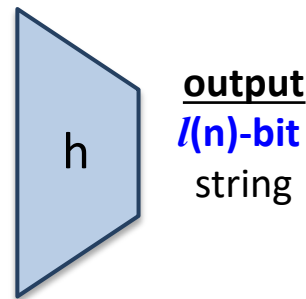

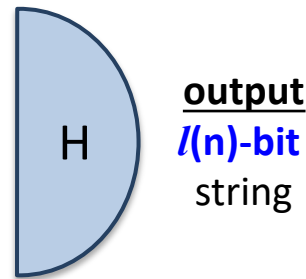

Important role in modern cryptography

- ◆ lie between symmetric- and asymmetric-key cryptography
- ◆ capture different security properties of “idealized random functions”
- ◆ qualitative stronger assumption than PRF

Hash & compression functions

Map messages to short digests

- ◆ a **general** hash function $H()$ maps
 - ◆ a message of an arbitrarily long string
- ◆ a **compression** (hash) function $h()$ maps
 - ◆ a long binary string to a shorter binary string
 - ◆ an $l'(n)$ -bit string to a $l(n)$ -bit string, with $l'(n) > l(n)$

Collision resistance (CR)

Attacker wins the game if $x \neq x' \text{ \& } H(x) = H(x')$

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

H is collision-resistant if any PPT \mathcal{A} wins the game only negligibly often.

Weaker security notions

Given a hash function $H: X \rightarrow Y$, then we say that H is

- ◆ **preimage resistant** (or **one-way**)

- ◆ if given $y \in Y$, finding a value $x \in X$ s.t. $H(x) = y$ happens negligibly often

- ◆ **2-nd preimage resistant**

- ◆ if given a uniform x and $H(x') = H(x)$ happens negligibly often

- ◆ cf. **collision resistant** (or **strong collision resistant**)

- ◆ if finding two distinct values $x', x \in X$, s.t. $H(x') = H(x)$ happens negligibly often

Add WeChat edu_assist_pro

Domain extension via the Merkle-Damgård transform

General design pattern for cryptographic hash functions

- ◆ reduces CR of general hash functions to CR of compression functions

- ◆ thus, in practice, it suffices to realize a collision-resistant compression function h
- ◆ compressing by 1 single bit is at least as hard as compressing by any number of bits!

Merkle-Damgård transform: Design

Suppose that $h: \{0,1\}^{2n} \rightarrow \{0,1\}^n$ is a collision-resistant compression function

Consider the general hash function $H: \mathcal{M} = \{x : |x| < 2^n\} \rightarrow \{0,1\}^n$, defined as

Assignment Project Exam Help

Merkle-Damgård design

- ◆ $H(x)$ is computed by a <https://eduassistpro.github.io/>
 $h()$ in a “**chained**” manner
over n -bit message blocks
- ◆ pad x to define a number, say B , **message blocks** x_1, \dots, x_B , with $|x_i| = n$
- ◆ set extra, final, message block x_{B+1} as an n -bit encoding L of $|x|$
- ◆ starting by initial digest $z_0 = IV = 0^n$, output $H(x) = z_{B+1}$, where $z_i = h^s(z_{i-1} \parallel x_i)$

Merkle-Damgård transform: Security

If the compression function h is CR,
then the derived hash function H is also CR!

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Compression function design: The Davies-Meyer scheme

Employs PRF w/ key length m & block length n

- ◆ define $h: \{0,1\}^{n+m} \rightarrow \{0,1\}^n$ as $h(x || k) = F_k(x) \text{ XOR } x$

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Security

- ◆ h is CR, if F is an ideal cipher

Add WeChat edu_assist_pro

Well known hash functions

- ◆ MD5 (designed in 1991)
 - ◆ output 128 bits, collision resistance **completely broken** by researchers in 2004
 - ◆ today (controlled) collisions can be found in less than a minute on a desktop PC
- ◆ SHA1 – the Secure Hash Algorithm (SHA-1) standardized by NIST
 - ◆ output 160 bits, collision resistance
 - ◆ **broken** in 2017 by r
- ◆ SHA2 (SHA-224, SHA-256, SHA-384, SHA-512)
 - ◆ outputs 224, 256, 384, and 512 bits, respectively, **no real security concerns yet**
 - ◆ based on Merkle-Damgård + Davies-Meyer generic transforms
- ◆ SHA3 (Kessac)
 - ◆ **completely new philosophy** (sponge construction + unkeyed permutations)
